Potential Impacts of Climate Change on U.S. Transportation

Briefing on the Results of a Study by the Committee on Climate Change and U.S. Transportation, Transportation Research Board, Division on Earth and Life Studies, National Research Council

Presented to the Northern Transportation and Air Quality Summit
Baltimore, Maryland

August 14, 2008

Presented by Dr. George C. Eads
Senior Consultant, CRA International
Member, Committee on Climate Change and U.S. Transportation
Study Sponsors

- Transportation Research Board
- U.S. Department of Transportation
- U.S. Army Corps of Engineers
- U.S. Environmental Protection Agency
- American Association of State Highway and Transportation Officials (AASHTO) (through the National Cooperative Highway Research Program)
- Transit Cooperative Research Program (TCRP)
Membership of Committee on Climate Change and U.S. Transportation

- **Henry G. Schwartz, Jr.,** Chair, Sverdrup/Jacobs Civil, Inc. (retired)
- **Alan C. Clark,** Houston-Galveston Area Council, Houston, Texas
- **G. Edward Dickey,** Loyola College, Baltimore, Maryland
- **George C. Eads,** CRA International, Washington, D.C. (retired)
- **Robert E. Gallamore,** The Gallamore Group, Rehoboth Beach, Delaware
- **Genevieve Giuliano,** University of Southern California, Los Angeles
- **William J. Gutowski, Jr.,** Iowa State University, Ames
- **Randall H. Iwasaki,** California Department of Transportation, Sacramento
Membership of Committee on Climate Change and U.S. Transportation (cont’d)

- **Klaus H. Jacob**, Columbia University, Palisades, New York
- **Thomas R. Karl**, National Oceanic and Atmospheric Administration, Asheville, North Carolina
- **Robert J. Lempert**, The Rand Corporation, Santa Monica, California
- **Luisa Paiewonsky**, Massachusetts Highway Department, Boston
- **S. George H. Philander**, Princeton University, Princeton, New Jersey (through 12/06)
- **Christopher R. Zeppie**, The Port Authority of New York and New Jersey, New York City
Study Charge

• Identify potential impacts on U.S. transportation and adaptation* options
• Provide overview of scientific consensus regarding climate change
• Summarize previous work on mitigation** strategies
• Provide recommendations on necessary research and policies

*Adaptation: Dealing with the consequences of something that has or will occur

**Mitigation: Taking steps to prevent something from occurring or to lessen its impact if it does occur
Main Findings

- Global warming **is occurring** and climate changes **are unlikely to unfold gradually**
- Historical weather and climate patterns **may no longer be a reliable planning guide**
- Impacts will affect **all** U.S. regions and **all** transportation modes
- Climate changes will require **significant changes** in planning, design, operation, and maintenance of the transportation infrastructure
- Today’s investment decisions will affect how well the infrastructure adapts to climate change far into the future
Climate Changes of Relevance to Transportation Over the Next 50-100 Years

• Rising sea levels (virtually certain – greater than 99% probability of occurrence)
• Increases in very hot days and heat waves (very likely – greater than 90% probability of occurrence)
• Increases in Arctic temperatures (virtually certain – greater than 99% probability of occurrence)
• Increases in intense precipitation events (very likely – greater than 90% probability of occurrence)
• Increases in hurricane intensity (likely – greater than 66% probability of occurrence)
Sea Level Rise Accompanied by Storm Surges

“It is virtually certain that sea levels will continue to rise in the 21st century as a result of thermal expansion and loss of mass from ice sheets. The projected global range in sea level rise is from 0.18 m to 0.59 m by 2099, but the rise will not be geographically uniform. The Atlantic and Gulf Coasts should experience a rise near the global mean, the West Coast a slightly lower rise, and the Arctic Coast a rise of only 0.1 m. These estimates do not include subsidence in the Gulf and uplift along the New England Coast. Nor do the global projections include the full effects of the Greenland and Antarctic ice masses because current understanding of these effects is too limited to permit projection of an upper bound on sea level rise.”

• Potential Impacts
  – Flooding of tunnels and low lying infrastructure
  – Erosion of bridge supports
  – Changes needed in harbors and ports
  – More severe storm surges requiring evacuation
  – Closure of several top 50 airports
  – Inundation of roads, rail lines, and runways in coastal areas
Increase in Very Hot Days/Heat Waves

“It is highly likely that heat extremes and heat waves will continue to become more intense, longer lasting, and more frequent in most regions during the 21st century. In 2007, for example, the probability of having five summer days at or above 43.3°C (110°F) in Dallas is about 2 percent. In 25 years, this probability increases to 5%; in 50 years, to 25%; and by 2099, to 90%.”

• Potential impacts
  – Thermal expansion – bridges and pavements
  – Pavement integrity
  – Rail track deformations
  – Lift-off limits at hot weather airports
  – Limitations on hours of construction
Increase in Arctic Temperatures

“Arctic warming is virtually certain, as temperature increases are expected to be greatest over land and at most high northern latitudes. As much as 90% of the upper layer of permafrost could thaw under more pessimistic emissions scenarios. The greatest temperature increases in North America are projected to occur in the winter in northern parts of Alaska and Canada as a result of feedback effects of shortened periods of snow cover. By the end of the 21st century, projected warming could range from as much as 10°C (18.0°F) in the winter to as little as 2.0°C (3.6°F) in the summer in the northernmost areas. On an annual mean temperature basis for the rest of North America, projected warming ranges from 3.0°C to 5.0°C (5.4°F to 9.0°F), with smaller values near the coast.”

• Potential impacts
  – More ice-free northwest passage
  – Longer ocean transport season
  – Thawing of permafrost – subsidence of highways, rail beds, pipelines, and runways
  – Shorter season for ice roads
Increase in Intense Precipitation Events

“It is highly likely that intense precipitation events will continue to become more frequent in widespread areas of the United States.”

• Potential impacts
  – Traffic disruptions
  – Increase in airline delays due to convective weather
  – Flooding of roadways, rail lines, runways
  – Scouring of pipeline supports and bridge foundations
More Frequent Strong Hurricanes

“Increased tropical storm intensities, with larger peak wind speeds and more intense precipitation are projected as likely. No robust projections concerning the annual global number of tropical storms has yet emerged from modeling studies, but more detailed analyses focused on the Atlantic Ocean suggest no significant increases in the annual number of Atlantic tropical storms.”

- **Potential impacts**
  - More frequent and costly evacuations
  - Greater probability of infrastructure failures
  - Failure of bridge decks
  - Interruptions to air service
  - Damage to ports and harbors
“Potentially, the greatest impact of climate change for North America’s transportation systems will be flooding of coastal roads, railways, transit systems, and runways because of global rising sea levels, coupled with storm surges and exacerbated in some locations by land subsidence”
Example: New York Airports, Tunnels, and Container Ports
Example: Vulnerable railroad infrastructure
Recommendations
Decision Framework and Data

- Inventory critical infrastructure, particularly in vulnerable locations
- Incorporate climate change in investment plans and decisions
- Adopt strategic, risk-based approaches to decision making
- Improve communication and establish information clearinghouse
- Research on climate science needs to address needs of transportation decision makers
Recommendations
Adaptation Strategies

• Integrate emergency response into transportation operations (and vice versa) to handle weather and climate extremes
• Reevaluate design standards – develop a research plan and cost proposal for Congressional action
  Rebuild infrastructure in vulnerable locations to higher standards
• Develop new technologies to track conditions and warn of pending failure
Recommendations
Adaptation Strategies (cont’d)

- Develop a mechanism for sharing best practices (AASHTO, FHWA, other professional organizations)
- Incorporate climate change into transportation and land use planning investment and development decisions
- Reevaluate National Flood Insurance Program and update flood zone maps to account for sea level rise
- Develop regional and multistate structures to address climate change impacts and create a federal interagency working group on adaptation
Where to Begin?

• Which climate changes most relevant for a region?
• How are climate changes likely to be manifest?
• What transportation assets will be affected?
• What performance levels are required?
• What level of investment is needed?
• What are the risks if no action is taken?
• Who will make these judgments and decisions?
• How will investment priorities be determined?
• How will they be funded?
